

Bug kill

Killing insects based on an insecticide produced by chrysanthemums - naturally

A major advance in killing insects based on an insecticide produced by chrysanthemums - naturally

What is Bug Kill?

Bug Kill is the newest and most effective form of insect spray. It is a blend of very effective insecticides. The main active ingredient is Permethrin, which is a synthetic chemical very similar to the natural insecticide produced by the Chrysanthemum. Bug Kill is packed in 750 ml aerosols, just right for tackling even large areas.

How does Bug Kill work?

Simply spray Bug Kill into each of the four corners of the room or in enclosed spaces, such as bins. Just spray inside the bin/room and close the lid or door. Firstly the Pyrethroids work by quickly paralysing the nervous system of the insect/bug on contact. The insecticide then quickly kills the insects, insect eggs, larvae, nymph, maggots or pupae. Lastly by leaving a residue in areas of infestation Bug Kill will continue to work.

Product Information

Bug Kill can be used at any stage of insect growth including: Flies, fleas, mites, ticks, mosquitos, gnats, ants, wasps and hornets.

Key features and benefits of Bug Kill

- Saves time
- Improves safety
- Improves the working environment
- Gets the job done

How to get the best results

No need to chase the insects, just spray in their general direction and the product will do all the work. IT DOES WHAT IT SAYS ON THE TIN!! If the windows and doors are open, just spray into the corners of the room for residual protection.
